ECON 0100 | HW D3 | Public Goods

Due: Sunday, Nov. 1

Homework is designed to both test your knowledge and challenge you to apply familiar concepts in new applications. You are welcomed and encouraged to work in groups as long as your work is your own. Submit your answers on Gradescope when you're finished: each answer there is a selection.

Q1 | Annual Yule Ball

Due to budget cuts, Hogwarts has decided not to hold the annual Yule Ball, which costs 1000 coins to host. In response, the student administration has come up with two proposals to fund the event. The first proposal is to raise everyone's tuition to cover the cost of the ball, and the second proposal is to sell tickets to students.

To evaluate these proposals, the student administration has collected data on each student's willingness to pay for a ticket to the Yule Ball by house. This data is presented in the table below. There are 100 students per house.

	Gryffindor	**Hufflepuff**	**Ravenclaw**	**Slytherin**
WTP	2	3	3	4

a) **Social Efficiency** Would the social planner choose to hold the Yule Ball? Remember, each house has 100 students, with each student's willingness to pay represented in the table. So for example, Gryffindor's total willingness to pay is 200 coins.

b) **Evaluating a Tuition Rise** The first proposal would raise everyone's tuition by 2.5 coins to cover the cost of the Yule Ball. If this proposal were voted on by the student body, would it receive a majority vote? Would you consider it fair?

c) **Evaluating Tickets** Instead, could the student administration generate enough ticket sales to cover their costs if they sold tickets to the Yule Ball? If so, what price would work?

Q2 | Lighting the High Street

Madam Rosmerta of the Three Broomsticks and Ambrosius Flume of Honeydukes have each set aside 12 coins this winter for lighting Hogsmeade's high street. Each chooses to contribute all 12 coins (C) or nothing (DC). The Hogsmeade Village Council asks each shop to send its contribution in a sealed envelope and opens both envelopes together at its next meeting, so neither shop knows what the other gave until it's too late to change. Every 12 coins contributed lights lamps worth 8 coins to each shop, whether or not that shop contributed. Each shop's payoff is the coins it keeps plus the value of the lamps.

		Flume	
		C	DC
Rosmerta	C		
	DC		

a) **Payoff Matrix** Fill in the payoff matrix above.

b) **Best Response** Identify Rosmerta's best response.

c) **Dominant Strategy** Identify Rosmerta's dominant strategy if one exists.

d) **Nash Equilibrium** Identify a Nash Equilibrium in this game if one exists.

e) **Social Efficiency** Find the socially efficient strategies.

Q3 | All or Nothing

The council learns that the old lamps cannot be lit one at a time. A new lighting charm for the whole street costs 24 coins, and it only works if it is paid in full. If only one shop contributes, its 12 coins are spent on a charm that fails and the street stays dark. If both contribute, the whole street is lit, worth 16 coins to each shop. As before, each shop chooses to contribute all 12 coins (C) or nothing (DC), and the council opens both sealed envelopes together. Each shop's payoff is the coins it keeps plus the value of the lights.

		Flume	
		C	DC
Rosmerta	C		
	DC		

a) **Payoff Matrix** Fill in the payoff matrix above.

b) **Best Responses** Identify the best responses of Rosmerta and Flume.

c) **Nash Equilibrium** Find all Nash Equilibria in this game.

d) **Social Efficiency** Find the socially efficient strategies.
