Hi Yu,

I've set up the rubric on Gradescope for the Noon section. The 1PM section will be up soon. I have you grading all parts of MiniExam Z, Question 2 and Question 3.

Here's the idea with how the rubric ranks students based on their understanding. Gradescope makes it easy to find all the correct answers. So we give full credit to these answers. The hard work will be going through the incorrect answers. You'll grade on process, with one point taken off for a math error, and half points taken off for a process error. It's more work this way than taking off points at each step, but it's the only fair thing to do. It's easy to simply group incorrect answers, but this isn't always fair. You're welcome to take a look through the incorrect groupings to check if students in these groups make similar mistakes. But be particularly careful with grouping incorrect answers and let me know how you do it.

Students will start Question 2 by finding a policy and the size of the policy. They will then use the tax to solve for prices, so make sure they get full credit if they get the prices wrong but solved for prices correctly using the incorrect policy they gave. Only take off one point if they made a math error. The connection to the socially efficient quantity is a big part of the question. So if they found an incorrect socially efficient quantity in Q1, they may use the wrong policy to get to that quantity in Q2. Make sure that if they're trying to use a policy to get to their quantity in Q1, that they get full credit. The aim is that they understand that a policy can get us to social efficiency, even if they made an earlier mistake. This might be easy to group on answer, but make sure you're confident that mistakes are the same in the groups. Use the graph to help understand if their process is good.

The DWL in Q3 is stand alone, so it's going to be somewhat simpler to grade. The tricky part will be trying to understand if they understand that it's the difference between MSC and MSB. I've added one rubric item, but I'd really like you to add a few more. I can't anticipate their answers here. They should be ranked based on how well they seem to understand the idea of DWL.

For all these questions, as you work through, you'll find additional gradations to add that I haven't anticipated. Just be sure to be consistent across sections with your new gradations.

As always, feel free to let me know if you run into any issues I haven't anticipated.

Almost done!

Taylor
